CATALOGUE

OF

1905 STARS

FOR THE EQUINOX

1865·0

FROM OBSERVATIONS MADE AT THE

ROYAL OBSERVATORY, CAPE OF GOOD HOPE,

DURING THE YEARS

1861 TO 1870,

UNDER THE DIRECTION OF

SIR THOMAS MACLEAR, KNT., F.R.S.,

HER MAJESTY'S ASTRONOMER AT THE CAPE.

REDUCED AND PUBLISHED UNDER THE DIRECTION OF

DAVID GILL, C.B., LL.D., F.R.S., *Hon.* F.R.S. *Ed.*, &c.

HER MAJESTY'S ASTRONOMER AT THE CAPE.

PUBLISHED BY ORDER OF THE LORDS COMMISSIONERS OF THE ADMIRALTY IN OBEDIENCE TO HER MAJESTY'S COMMAND.

LONDON:
PRINTED FOR HER MAJESTY'S STATIONERY OFFICE,
BY EYRE AND SPOTTISWOODE,
PRINTERS TO THE QUEEN'S MOST EXCELLENT MAJESTY.

And to be purchased, either directly or through any Bookseller, from
EYRE & SPOTTISWOODE, EAST HARDING STREET, FLEET STREET, E.C.; or
JOHN MENZIES & CO., 12, HANOVER STREET, EDINBURGH, and
90, WEST NILE STREET, GLASGOW; or
HODGES, FIGGIS, & CO., LIMITED, 104, GRAFTON STREET, DUBLIN.

1899.

Price Four Shillings.

PREFACE.

The publication of this Catalogue marks an epoch in the history of the Observatory. For the first time in that history the Director can feel that the accumulated labours of his predecessors are available for the use of Astronomers, and that the work being done under his own direction is in a healthy and forward state of reduction and publication. How heavily the load of arrears pressed upon my predecessor is evidenced by his remarks in the introduction to the Cape Catalogue for 1860:

"When I assumed the Directorship in 1870, I found myself, with a very limited staff, unexpectedly confronted with the results of 36 years of miscellaneous observing in all stages of reduction, nothing completed, and nothing which could be brought forward for publication and use without a very considerable expenditure of time and skilled labour."

Astronomers are greatly indebted to Mr. Stone for the energy and determination with which he faced the odds against him, and for the manner in which he cleared off a large share of these arrears by his publication of the Catalogues for 1840 and 1860.

Together with the discouragement and vexation which the existence of such arrears gives to an Astronomer who is desirous of pushing forward investigations in which he is more immediately interested, there must also be the feeling that every increase in the delay of publication means a hindrance to the progress of science. How serious those hindrances have been will be evident from the following table, which shows the dates at which the various series of Cape Meridian Observations, made previous to 1870, were published in the form of Star Catalogues:—

Astronomer under whose Direction the Observations were made.	Period covered by the Observations.	Date of Publication.	Name of Astronomer by whom Published.	Delay in Publication after Completion of the Observations.
Fallows - - -	1829–31	1851	Airy - -	20 years.
Henderson - -	1832–33	{ R.A. 1844 { Dec. 1837	} Henderson	{ 11 „ { 4 „
Maclear - - -	1834–40	1878	Stone -	38 „
Maclear - -	1843–48	1866	Maclear -	18 „
Maclear - - -	1849–52	1885	Gill - -	33 „

E (3)8567. 500.—1/1900. Wt. 9561. E. & S.

No blame can be attached to the earlier Cape Astronomers for these delays. Their official instructions were to carry on the same work as at Greenwich, but it did not apparently occur to the authorities at home that a similar staff to that at Greenwich was required for its regular reduction and publication. There was no Board of Visitors, as at Greenwich, to support the demands of the Astronomer for adequate assistance, and his requests were too often treated with coldness and neglect.

Fortunately a more enlightened spirit now prevails, and it is due to the wise liberality of the Admiralty, and to the devotion of his staff, that H.M. Astronomer is now able to report that the arrears of publication of the Cape Meridian Observations no longer exist.

The services of Mr. J. Power are specially noteworthy in connection with the preparation of the present work for press.

INTRODUCTION TO THE CAPE CATALOGUE, 1865.

This Catalogue of 1,905 Stars is based on observations made with the Cape Transit-Circle under the direction of Sir Thomas Maclear during the years 1861, '62, '63, '64, '65, '66, '67, '68, '69, and part of the year 1870.

The Right Ascensions and Declinations of the Catalogue are given for the Mean Epoch of Observation, reduced *without Proper Motion* to the Equinox 1865·0.

The Royal Observatory at the Cape of Good Hope was established by an Order in Council dated 1820, October 20, but it was not until 1829 that the buildings and instruments were erected and regular observing was commenced.

The Reverend Fearon Fallows, who had supervised the work and waited patiently through years of worry and delay for an opportunity to realize the hopes which had brought him to the Cape, lost his excellent assistant Captain Ronald in 1830. He struggled on as best he could with his wife's aid through many difficulties and under much discouragement, and died in July 1831, at the age of 43. Fallows' observations, 1829–31, were finally reduced under Airy's direction, and published in 1851. (Mem. R.A.S., Vol. XIX.)

Henderson succeeded Fallows, but was driven by the discomforts of his position and the want of adequate assistance to resign the appointment in 1833, after occupying his post for little more than a year.

The valuable observations obtained during that short period were reduced by him in Edinburgh. In 1837 he published the Mean Declinations of 172 stars (Mem. R.A.S., Vol. X.), and in 1844 the Right Ascensions of 174 stars derived from observations made by himself and his only assistant, Lieutenant Meadows, in 1832–33 (Mem. R.A.S., Vol. XV.). Henderson's brief tenure of office at the Cape will ever be memorable from the fact that he obtained from his observations of α Centauri the first reliable evidence of the parallax of any fixed star.

Mr. (afterwards Sir Thomas) Maclear, succeeded Henderson in 1834, and during the 36 years of his directorate (1834 to 1870) great stores of Meridian Observations were accumulated, but his work on the Arc of Meridian, and the weakness of his staff, did not permit him to complete the reduction. The observations with the Transit Instrument

and Mural Circle 1834 to 1840 had, however, been nearly completed by him, and the results were finally revised and published in 1878, under the direction of his successor, Mr. E. J. Stone, in form of the Cape Catalogue of 2,892 Stars for the Equinox 1840.

In 1841 Maclear commenced the field work of his "Verification and extension of Lacaille's Arc of Meridian," and until its termination in 1848 the Meridian work of the Observatory was necessarily limited in extent, being chiefly confined to the determination of time and the observation of stars with the Zenith Sector in connection with Geodetic operations. The results of his observations with the Zenith Sector, 1843-48, were published by him in 1866 (Verification and Extension of Lacaille's Arc of Meridian, Vol. II.). Maclear's immediate object in the arrangement of the observations from 1849 was to observe all stars of the British Association Catalogue South of the Equator, and a great deal of time was spent in endeavours to reconcile the observations of Lacaille and others with his own recent determinations. Many interesting discussions on this subject are printed in the Memoirs of the R.A.S., Vol. XX., but apart from this the reductions were left by Maclear in a very incomplete state. Some further work towards their reduction was done as opportunity offered during the period of Mr. Stone's directorate, 1870–79. The work was finally completed, and the results prepared for press, under the direction of the writer; it was published in 1885 as the Cape Catalogue of 4,810 Stars for the Equinox 1850, from observations made during the years 1849 to 1852. During 1853–54 and '55 regular observing, except for time, &c., was discontinued, the staff being probably chiefly occupied with computations connected with the Arc of Meridian and with preparations for the erection of the new Transit Circle.

Regular observing with the new Transit-Circle was begun in 1856, and the reduction of the observations of that and the four succeeding years was finally completed by Mr. Stone, and published by him in 1873, under the title of the Cape Catalogue of 1159 Stars for the Equinox 1860.

Mr. Stone also published in separate form the results of the annual observations for 1856, '57, '58, '59, and '60.

There remained for reduction the observations made during the years 1861-70, both inclusive, but it was not until the policy was adopted, in 1892, of suspending all meridian observing during that and the following year, to allow arrears of reduction to be overtaken, and a subsequent increase of the Staff was granted, that it became possible to undertake this work.

The annual results for the years 1861 to 1865 were published in 1897, those for 1866 to 1870 are in the press, and should appear before this Catalogue.

Explanation of the Separate Columns of the Catalogue.

Left-Hand Page.

"No." is the rotation number. An asterisk (*) attached to this number signifies that the star is one of the Fundamental Stars for the zones of Schönfeld's *Durchmusterung* (Ast. Nach. 2890-91); a dagger (†), that the star is one of the Fundamental Stars for subsequent meridian observation of the zones of the Cape *Durchmusterung*, between 20° and 80° of South Declination (Auwers, *Monthly Notices*, R.A.S., Vol. XLVII., pp. 455-473, and Ast. Nach. 3431-32). When a star not contained in one of the above-mentioned lists occurs in Auwers' Catalogues (Pub. de Astron. Gesellschaft, XIV. and XVII.), it is denoted by a double dagger (‡).

"Star's Name."—For stars contained in Auwers' Bradley the nomenclature of that work has been retained, only substituting *Argûs* or *Puppis* for *Navis*. For stars not in Auwers' Bradley the nomenclature of Auwers' Fundamental Lists was adopted. For stars not contained in these lists between Declination — 23° and the South Pole the nomenclature of the Argentine General Catalogue was employed, and for stars North of Declination — 23° that of the B.A.C.

The only exceptions to these rules are a very few close Circumpolar Stars, which are designated by letters long in use at the Cape.

For stars otherwise unnamed the Catalogue number is referred to in the following order of preference :—

(1.) Auwers' Bradley, referred to as Bradley.

(2.) British Association Catalogue of Lacaille's Observations, referred to as Lacaille.

(3.) The Hour and Number in Piazzi's Catalogue (Edition of 1814).

(4.) Lalande's Catalogue, published by the British Association.

(5.) The Hour and Number in Weisse's Catalogues of the Stars in Bessel's zones, the zones — 15° to + 15° being referred to as W.B., and the zones + 15° to + 45° as W.B.(2).

(6.) Brisbane's Catalogue.

(7.) Gould's "Catalogo General Argentino," referred to as C.G.A.

(8.) The Cape Catalogue of 12,441 Stars, referred to as Cape (1880).

(9.) The Hour and Number in the Cordoba Zone Catalogue, referred to as C.Z.

(10.) The *Bonner Durchmusterung*, referred to as B.D.

(11.) The *Cape Photographic Durchmusterung*, referred to as C.P.D.

(12.) The *Cordoba Durchmusterung*, referred to as Cor. D.

All notes respecting nomenclature are given on the left-hand page.

"Mag."—This column gives the magnitude of the star. Those magnitudes which are unmarked are taken from the Harvard Photometry or the Southern Meridian Photometry. Magnitudes marked * are taken from the C.G.A., C.Z., or Cor. D., those marked † from B.D., and those marked ‡ from Cape observations.

Where a doubt exists as to whether the "Mass" or one component of a double star was observed, an asterisk is inserted instead of the magnitude.

The particulars respecting variable stars are from Chandler's Catalogue (*Astron. Journal*, No. 379), unless otherwise stated.

"Mean Date."—The mean epoch of the observations in R.A. expressed in years from 1800.

"No. of Obs."—The number of observations in Right Ascension.

"Mean R.A. 1865·0."—The formation of the Right Ascensions is explained on p. viii.; the results here given refer to the mean epoch of observation and the Equinox 1865·0.

"Corr. for $\mu\alpha$ to 1865·0."—For the convenience of Astronomers who may desire to compare this Catalogue with others reduced to the Epoch and Equinox 1865·0, this column gives the correction to be applied on account of Proper Motion to the R.A. of the present Catalogue, to reduce the catalogue-place from the Epoch of Observation to the Epoch 1865·0.

"Prec. 1865·0"—The annual Precession in R.A., computed from the formula—

$$3^s\cdot0721 + 1^s\cdot3370 \sin\alpha \tan\delta.$$

"Sec. Var."—The Secular Variation, computed by the formula—

$$A + B \tan\delta + C \tan^2\delta,$$

where—

$$A = 0^s\cdot00190 + 0^s\cdot00650 \sin 2\alpha.$$
$$B = -0^s\cdot00057 \sin\alpha + 0^s\cdot02987 \cos\alpha.$$
$$C = +0^s\cdot01300 \sin 2\alpha.$$

"Proper Motion, μ_α."—Proper Motions without mark or note were taken from Auwers' determinations, the latest determination being preferred. Those taken from the Cape Catalogue, 1880, or the Radcliffe Catalogue, 1890, are marked with an asterisk, those from the Cape Catalogue being given to 2 and 3 decimal places in R.A. and Dec. respectively, those from the Radcliffe Catalogue to 4 and 3 places. Those from other authorities are mentioned in notes on the right-hand page.

Right-Hand Page.

"No."—An asterisk attached to this number signifies that there is a foot-note referring to the star.

"Mean Date."—The mean epoch of observation expressed in years from 1865·0.

"No. of Obs."—The number of Observations in Declination.

"Mean Dec. 1865·0."—The formation of the Declinations is fully explained pp. viii.–xiii.; the results here given refer to the Mean Epoch of Observation and the Equinox 1865·0.

"Corr. for μ_δ' to 1865·0."—This column gives the correction to be applied on account of Proper Motion to the Declination of the present Catalogue, in order to reduce the catalogue-place from the Mean Epoch of Observation to the Epoch 1865·0.

"Prec. 1865·0."—The annual Precession in Declination computed by the formula—

$$20''\cdot0551 \cos \alpha.$$

"Sec. Var. 1865·0"—The Secular Variation for 1865·0 computed by the formula:—

$$A^1 + B^1 \tan \delta,$$

where—

$$A^1 = -0''\cdot0086 \cos \alpha - 0''\cdot4480 \sin \alpha.$$
$$B^1 = -0''\cdot1950 \sin^2 \alpha.$$

"Proper Motion, μ_δ."—The annual Proper Motion in Declination. The authority for the adopted values is denoted in the same manner as for the Right Ascensions.

"Bradley or Lacaille."—This column gives the corresponding number in Auwers' "*Neue Reduction der Bradleyschen Beobachtungen*" or that in the British Association Catalogue of Lacaille's Observations—"*Catalogue of 9,766 Stars in the Southern Hemisphere.*" When the star is in one of these Catalogues only, the Numeration or the Declination is sufficient to indicate to which of the two

catalogues it belongs; when the star is in both catalogues the Bradley Number is given with an asterisk attached.

The other columns of reference are sufficiently explained by their respective headings.

Right Ascensions.

The system of Right Ascension is that of Auwers' *Fundamental Catalog für die Zonen Beobachtungen am Nordlichen Himmel.* .

The list of Clock Stars actually employed is given, p. viii. and ix. of the Cape Meridian Observations, 1861–65, together with the corrections required to be applied to the Right Ascensions given in the Nautical Almanacs for 1860 and 1870 to reduce to the places of Auwers' Catalogue.

The Right Ascensions of Clock Stars have not been retained as determinations unless clock-error was obtained from at least five Fundamental Stars on the same day.

Declinations.

The Declinations given in the Annual Catalogues, 1861–70, were formed on the assumptions:—

1. That the correction for instrumental flexure is $-0''.26$ sin Z.D.
2. That the refractions of Bessel's *Tabulæ Regiomontanæ* require no correction.
3. That the Latitude is $-33^\circ\ 56'\ 3''.20$.

Unfortunately the data for a rigorous determination of Latitude are both scanty and unsatisfactory. The thermometer employed was placed in a crib in the S.W. window of the Transit Room; it was constructed by Dollond, had a large cylindrical bulb, and its graduations were engraved on an attached ivory scale. This thermometer was accidentally broken many years ago, and we have no certain knowledge of its calibration and index-errors. The situation of the crib, surrounded as it is by the heavy masonry of the walls, gives no true indication of the temperature of the air, and there are instances when thermometers in this crib indicate a temperature 10° F. different from that of the outer air.

The number of Circumpolar Stars is also comparatively small, and the range of Declination is insufficient to afford data for discussing the general errors of the refractions.

Assuming the Refractions of the *Tabulæ Reg.*, corresponding to the readings of the crib-Dollond Thermometer, to represent the true refractions, we have the following corrections to the assumed Latitude $-33^\circ\ 56'\ 3''.20$.

Observations of Circumpolar Stars for Latitude.

The resulting corrections to the Latitude ϕ, which was employed in the formation of the Annual Results, and the corrections to that

Latitude which have been adopted in the formation of the present Catalogue are as follows :—

Year.	Correction to ϕ, derived from Obs. of Circumpolars.		Corrections adopted in formation of the Catalogue.
	″	Weight.	″
1861 - - -	−0·27	54	−0·50
1862 - - -	−0·67	36	
1863 - - -	−0·93	58	−0·90
1864 - - -	−0·72	57	
1865 - - -	−1·00	75	
1866 - - -	−0·71	32	
1867 - - -	−1·05	70	
1868 - - -	−0·95	49	
1869 - - -	−0·93	24	
1870 - - -	−0·98	16	

I have been unable to find any satisfactory explanation for the marked apparent change of Latitude between 1862 and 1863.

The separate observations of α Canis Majoris α Canis Minoris, β Centauri, and α Centauri reduced to the Equinox 1865·0, are given in an Appendix to the Catalogue.

General Remarks and Comparison with Newcomb.

Besides the uncertainties which exist in the Declinations, there are other reasons why this Catalogue should not be regarded as a Fundamental one.

Sir Thomas Maclear, Mr. Mann, and Mr. Geo. Maclear were good observers, but only the last-mentioned of these took any considerable share in the work. The personal equations of the other observers are both large and variable, and their work is unsatisfactory. There is a want of plan and method in the conduct of the work, and many observations had to be rejected from want of reliable determination of clock-error or other instrumental constants. It is hoped that the observations which have been retained are sufficiently reliable, and that the Catalogue may not be without some value.

The following comparison with Newcomb's New Fundamental Catalogue, 1875 and 1900, may serve for determining the systematic errors of the present Catalogue, and for its comparison with others.

For this comparison the stars common to both catalogues were selected, and their places in the 1865 Catalogue were reduced to the Equinox and Epoch 1875, employing the Precessions and Proper Motions of Newcomb's Catalogue; the differences "Newcomb—Cape" were then formed. These differences were then combined in groups corresponding to zones of 5° in Declination and the mean value of N.—C. was taken having regard to the following system of weights :—

No. of Obs. in the Cape Cat., 1865.	Weight.
1	1
2–4	2
5–8	3
9 or more	4

Grouping similarly for each hour of R.A., the mean value of N.—C. was found, in which equal weight was given to each value of N.—C. The results are given in the following table :—

Comparison of the Cape Catalogue for 1865 with Newcomb's new Fundamental Catalogue for 1875 and 1900.

247. Binary; $^{m}3{\cdot}9, 6{\cdot}9$. Probably seen as one star.

259. $^{m}3{\cdot}8, 9{\cdot}4, 5{\cdot}^{''}4, 282.^{\circ}$ Fainter star probably not seen.

m m
877. Suspected Variable; 4·2 to 5·1 in *Uranometria Argentina*.
890. Limits of Magnitude 4·5−6·1 to 6·3. Irregularly periodic.
901. Limits of Magnitude > 1−7·4. Period irregular.

CAPE GENERAL CATALOGUE OF STARS FOR 1865·0.

APPENDIX.

MERIDIAN OBSERVATIONS

OF THE STARS

α CANIS MAJORIS, α CANIS MINORIS,
β CENTAURI α^1 AND α^2 CENTAURI.

Corrected for Flexure (−0″·26 Sin Z.D.), Latitude (1861–2 = −33° 56′ 3″·70 : 1863–70 = 4″·10) and reduced, without Proper Motion, to the Equinox 1865·0.

MERIDIAN OBSERVATIONS of α CANIS MAJORIS.

Direct Observations.
